

ABSTRACT OF THE DISCLOSURE

A system and method of translating information using, for example, a cellular telephone. A user inputs information into the system for translation into another language. The inputted information can be in any media type, format or language. The inputted information is stored in a MMS server and is accessed by a dictionary server. The dictionary server translates the inputted information into the media type, format and/or language that the user requests. The translated information is then sent to the user as a MMS message that is accessible to the user's cellular telephone.
